

Bluesky Post Explainer

2 days · OpenAI key provided

The Task

Build an AI agent that explains Bluesky posts by searching for relevant context.

Example input

Example output

- The "Ralph Wiggum technique" is a bash-loop method for iterating AI coding agents until tasks complete, named after the Simpsons character for its trial-and-error style.
- Coined by Geoffrey Huntley in mid-2025, it gained traction for its simplicity over elaborate agentic frameworks.
- Spawned derivatives including the \$RALPH Solana token.

This is the kind of context we expect the agent to surface.

Submit

One GitHub repo containing:

Agent	Takes a Bluesky post URL, searches, returns 3-5 bullets
Eval harness	10+ Bluesky posts with expected outputs
README	Setup instructions, design decisions

What We Care About

Does the agent produce useful explanations? Is the eval harness thoughtful? Is the code clean?

Bonus: image understanding, multi-provider comparison, citations
